

Events

Facility Scheduler lets you enter events with the date, time, event name, description, calendars, location, notes, event type (such as Wedding with additional fields), status, resources, and attachments. You can also enter whether the event is published for everyone and if registrations are allowed.

Our Facility Scheduler APIs are designed to pull these fields out of your databases, but not all data for a single event comes from a single table.

The **AllowRegistration** flag let you know if a specific event allows event registration. We have not designed APIs for this database, and it is easier to use the application directly.

The Event Registration URLs can be found inside Access ACS. You can use one of three URLs:

This lists all events that are public and individuals can register for today and in the future.

- Log into Access ACS with someone with administrator rights.
- On the **Admin** tab, select **Options**.
- Select the **Web Links** tab.
- Under **General**, copy the **Event Registration** link.

Use this script to show this particular event on the website.

- Log into Access ACS with someone with rights to Event Registration Setup.
- On the **Events** tab, select **Event Setup**.
- Select the link for the event you wish to register for.
- In the **Web Links** section, select the first link.

Use this URL to the registration link using the site's CSS.

- Log into Access ACS with someone with rights to Event Registration Setup.
- On the **Events** tab, select **Event Setup**.
- Select the link for the event you wish to register for.
- In the **Web Links** section, select the second link.
